

Drive the Future

AutoWorld

Project

Documentation

A complete front-end website report for car discovery, dealership support, comparison, finance guidance, warranty information and customer inquiry handling.

Document Type	Project Documentation
Project Name	AutoWorld Website
Technology	HTML, CSS and JavaScript
Version	Final Documentation
Prepared Date	30 June 2026

Prepared after reviewing the actual project files, page structure, styling, scripts and supplied browser screenshots.

1. Executive Summary

AutoWorld is a static front-end website developed as an internet gateway for car dealership information. The website helps visitors browse vehicle options, compare selected cars, locate verified dealers, review warranty support, estimate finance support and contact the company for further guidance.

The inspected project is organized as a multi-page website. It uses HTML for page structure, CSS for layout and visual design, and JavaScript for front-end interaction. No backend server, database, authentication system or payment gateway is included in the current version, so the project is best understood as a presentation-ready front-end implementation.

Area	Project Detail
Project Type	Responsive car dealership information and support website
Primary Purpose	Support car discovery, comparison, dealer lookup, finance guidance, warranty review and customer inquiry handling
Development Approach	Static front-end implementation using local project files and JavaScript data arrays
Main Output	A complete browser-based AutoWorld website with multiple linked pages and interactive sections

2. Project Introduction

Buying a car usually requires information from several places: model details, prices, dealer contacts, warranty plans, financing options and test-drive booking. AutoWorld brings these decision points into one organized website so a visitor can move from browsing to inquiry without confusion.

The website has a premium automotive look. It uses a navy, white and red color system, card-based sections, modern hero banners, dealership visuals and clear call-to-action buttons. The content is written for users who want practical car information rather than a complicated technical portal.

2.1 Problem Statement

Many users face difficulty when they have to check car prices, compare models, find dealers and understand warranty or finance details separately. AutoWorld addresses this issue by presenting important dealership information in a single structured website.

2.2 Proposed Solution

The solution is a front-end web platform where users can search cars, view featured vehicles, compare up to three models, locate dealers, check warranty support, use a simple finance calculator and send contact or booking requests through forms.

3. Project Objectives

- Create a clean and professional car dealership website with a premium interface.
- Allow users to browse cars by brand, model, city and price range.
- Show car details such as price, engine, mileage, city, body type and best-use category.
- Provide a side-by-side comparison feature for selected vehicles.
- List verified dealer locations with brand and city-based search support.
- Explain finance support through bank scheme cards and a loan calculator.
- Provide brand-wise warranty and insurance guidance before purchase.

- Offer contact and test-drive booking forms for customer communication.
- Keep the website responsive and visually consistent across all pages.

4. Scope of Work

4.1 Included Scope

Scope Area	Description
Website Structure	Multi-page website with shared header, navigation, footer and page-specific sections.
Vehicle Inventory	Front-end vehicle listing powered by JavaScript array records.
Car Filtering	Brand, model, price and city selection through form controls.
Dealer Locator	Brand and city-based dealer lookup with showroom cards and map reference.
Comparison	Side-by-side comparison table for selected vehicles.
Finance	Loan support explanation, finance scheme cards and basic monthly installment calculation.
Warranty	Brand-wise warranty cards and a simple claim process section.
Contact and Booking	Contact query form, newsletter input and test-drive booking form.

4.2 Out of Scope

- Live backend database integration.
- User login, dashboard or account management.
- Real-time vehicle inventory synchronization with dealerships.
- Actual online payment, loan approval or insurance processing.
- Email delivery or admin panel for received form submissions.

5. Stakeholders and Target Users

Stakeholder / User	Need from the Website
Car Buyers	Browse available vehicles, compare options and request support before purchase.
Students and First-Time Buyers	Find city-friendly and affordable vehicles with basic guidance.
Families	Explore spacious and reliable cars suitable for family use.
Premium Buyers	Review higher-end cars, finance support and warranty plans.
Dealership Staff	Present dealer details, test-drive support and customer inquiry channels.
Project Evaluator	Review front-end structure, usability, design consistency and implemented features.

6. Technology Stack

Technology	Use in Project	Reason for Use
HTML5	Builds page structure, forms, navigation and content sections.	Simple, standard and suitable for a static academic/project website.

CSS3	Controls responsive layout, colors, typography, cards, shadows, hero sections and animation.	Gives the project a consistent premium visual identity.
JavaScript	Handles car rendering, filtering, comparison, modals, loan calculation, dealer search and form notices.	Adds front-end interactivity without using a backend.
OpenStreetMap Embed	Displays map references on contact and dealer pages.	Provides location support without complex map programming.
Local Assets	Stores logo, page banners, icons and videos inside the project folder.	Keeps the website visually complete and easier to run locally.

7. Project Folder Structure

```

AutoWorld/
├─ autoworld_site/
│   ├── index.html
│   ├── see-your-car.html
│   ├── dealers.html
│   ├── compare.html
│   ├── finance.html
│   ├── finance-details.html
│   ├── warranty.html
│   ├── about.html
│   ├── contact.html
│   ├── book-me.html
│   ├── css/
│   │   └─ style.css
│   ├── js/

│       ├── logo-reveal.mp4
│       ├── page images
│       └─ social and category icons

```

File / Folder	Purpose
index.html	Landing page with hero, quick search, need-based categories, featured cars, dealer finder, benefits and testimonials.
see-your-car.html	Inventory page for browsing and filtering car cards.
dealers.html	Dealer search and dealer location cards.
compare.html	Comparison page for selected cars and recommended options.
finance.html	Finance support page with loan calculator and bank options.
finance-details.html	Detailed information page for selected finance partner.
warranty.html	Warranty and insurance guidance page.
about.html	Project and company introduction page.

contact.html	Company contact details, map and query form.
book-me.html	Test-drive booking and support request page.
css/style.css	Central stylesheet for complete website design.
js/script.js	Central JavaScript file for all front-end logic.
assets/	Images, icons and videos used across pages.

11. User Interface and Design System

The website uses a premium automotive theme. The design is based on dark navy sections, red highlight buttons, white content cards and soft shadows. This gives the project a dealership-style look while keeping the pages easy to read.

Design Element	Implementation
Color Palette	Navy and white base with red accent color for buttons, active navigation and section emphasis.
Typography	Large hero headings, readable body text and bold card titles.
Layout	Hero sections, card grids, two-column support sections and consistent footer blocks.
Navigation	Top contact strip, main navbar, active state and prominent Book a Test Drive button.
Cards	Rounded white cards with shadows for vehicles, dealer locations, warranty plans, finance options and testimonials.
Visual Media	Car images, dealership visuals, page banners, logo video and map embeds.
Micro-Interactions	Scroll reveal animation, menu toggle, card modal, scroll-to-top button and form notices.

13. Data Model and Content Structure

The website stores its core display data in JavaScript. This is suitable for a static project because the browser can render the required information without a server. In a production version, these records would normally be moved into a database or content management system.

13.1 Car Record Fields

Field	Purpose
id	Unique number used to identify a car.
brand	Manufacturer or brand name such as Toyota, Honda or Suzuki.
model	Model name used for search and display.
name	Complete car display name shown on cards.
variant	Variant or trim information.
price / priceText	Numeric price for filtering and formatted price for display.
engine	Engine capacity or engine type.
mileage	Estimated fuel average.
city	Dealer or availability city.
body	Body category such as Sedan, SUV, Crossover or Hatchback.
bestFor	User need category such as Family, City, Luxury, Hybrid or Premium.
features	Short description shown in detail view.
image / fallbackImage	Main car image and fallback image URL.
source / sourceUrl	Source label and reference URL for car image/details.

13.2 Sample Car Records

Name	Brand	Price	Engine	Mileage	City
Toyota Corolla Altis X	Toyota	From PKR 6,169,000	1.6L / 1.8L Dual VVT-i	12-14 km/l	Karachi
Toyota Yaris	Toyota	From PKR 4,479,000	1.3L / 1.5L	14-16 km/l	Lahore
Toyota Fortuner	Toyota	From PKR 14,999,000	2.7L Petrol / 2.8L Diesel	9-11 km/l	Islamabad
Toyota Corolla Cross	Toyota	From PKR 12,249,000	1.8L Hybrid / Gasoline	16-20 km/l	Karachi
Honda City 1.2LS	Honda	PKR 4,737,000	1.2L i-VTEC	14-17 km/l	Karachi

13.3 Brands and Cities Covered

Brands covered in the current data: Toyota, Honda, Suzuki, Hyundai, Kia, BMW, Ford.

Cities covered in the current data: Karachi, Lahore, Islamabad, Hyderabad.

13.4 Form Field Specification

Form	Fields	Purpose
Home Search	Brand, model, max price and city	Quickly forwards the user toward filtered car discovery.

Inventory Filter	Keyword, brand, city and price	Controls the car listing shown on the inventory page.
Dealer Search	Dealer brand and dealer city	Finds matching dealer contact information.
Contact Query	Full name, phone number, email, query type and message	Captures the customer inquiry details in the front-end interface.
Book Test Drive	Full name, phone, email, preferred car, date, support type and message	Represents a test-drive or consultation request.
Newsletter	Email address	Allows visitors to subscribe to updates in the footer interface.

14. Main User Workflows

Primary User Journey

The flow is kept simple so visitors can move from browsing to decision support without leaving the website.

Workflow	Steps	Expected Result
Car Search	User opens Home or See Your Car, selects brand/model/price/city, then applies filter.	Relevant car cards are displayed based on selected criteria.
View Car Details	User clicks View Details on a car card.	A modal/detail panel presents expanded vehicle information.
Compare Cars	User opens Compare page and selects up to three vehicles.	Comparison table updates with price, brand, engine, mileage, body type, best use and dealer city.
Find Dealer	User selects dealer brand and city.	Website shows matching dealer address and contact information.
Calculate Finance	User enters car price and duration.	Website calculates 60% finance support, down payment and monthly installment estimate.
Submit Query	User fills contact or booking form.	Front-end notice confirms that the form request has been received in the interface.

17. Installation and Deployment

17.1 Local Installation

1. Extract the AutoWorld project zip file.
2. Open the AutoWorld/autoworld_site folder.
3. Double-click index.html or open it with a browser.
4. Use the navbar to move between pages.
5. Keep the css, js and assets folders in the same location as the HTML files so links continue working.

17.2 Deployment Option

Because this is a static front-end website, it can be deployed on static hosting platforms such as Netlify, GitHub Pages, Vercel static hosting or any standard web server. The deployment folder should be the autoworld_site directory.

Deployment Step	Description
Upload Folder	Upload the complete autoworld_site folder.
Set Entry File	Use index.html as the main entry page.
Check Paths	Verify that css/style.css, js/script.js and assets are loading correctly.
Test Pages	Open every navbar page after deployment and check forms, images and JavaScript features.

18. Limitations

The current version is strong as a front-end project, but it has natural limitations because it does not include backend services.

- Vehicle records are stored inside JavaScript rather than a database.
- Contact and booking forms do not submit to email, database or admin dashboard.
- Finance calculation is an estimate and does not represent actual bank approval or markup calculation.
- Dealer information is static and must be manually updated in the code.
- There is no user account, saved favorites or booking tracking system.
- External image URLs may fail if the original source changes or blocks loading.

19. Future Enhancements

Enhancement	Benefit
Backend Database	Store cars, dealers, finance schemes, bookings and contact queries dynamically.
Admin Panel	Allow staff to add cars, update prices and manage dealer records without editing code.
Authentication	Enable users to save favorite cars and track booking requests.
Real Form Submission	Send contact and booking details to email or database.
Advanced Finance Module	Add markup rate, down payment percentage, bank fees and amortization schedule.
Live Inventory	Connect dealerships to live availability and city-wise stock.
Search Optimization	Add keyword ranking, sorting, pagination and recently viewed cars.
Accessibility Improvements	Add stronger keyboard navigation, visible focus states and ARIA support.
Performance Optimization	Compress large media files and use lazy loading for car images.
Analytics	Track most viewed cars, popular searches and submitted inquiries.

20. Conclusion

AutoWorld successfully presents a complete front-end car dealership information website. It covers the main decision areas users normally need before contacting a dealer: car browsing, model comparison, dealer location, warranty support, finance guidance and booking/contact forms.

The project is suitable for academic demonstration because it has multiple pages, a consistent interface, meaningful content, reusable components and practical JavaScript interactions. The next major step would be backend integration so the website can store real inventory records and process customer requests.
